Travel Vaccines in General Practice: Challenges and Approaches to Vaccinating the Outbound traveller

Dr Deb Mills
MBBS MPHTM
7.10.23

CONFLICTS of INTEREST

- **Given talks for Sanofi, Sequiris, GSK**
- **Research funding Sanofi**
- **Book**
- **Run a Travel Clinic**

**Travel medicine is
more than just
vaccines**

What they don't tell you...

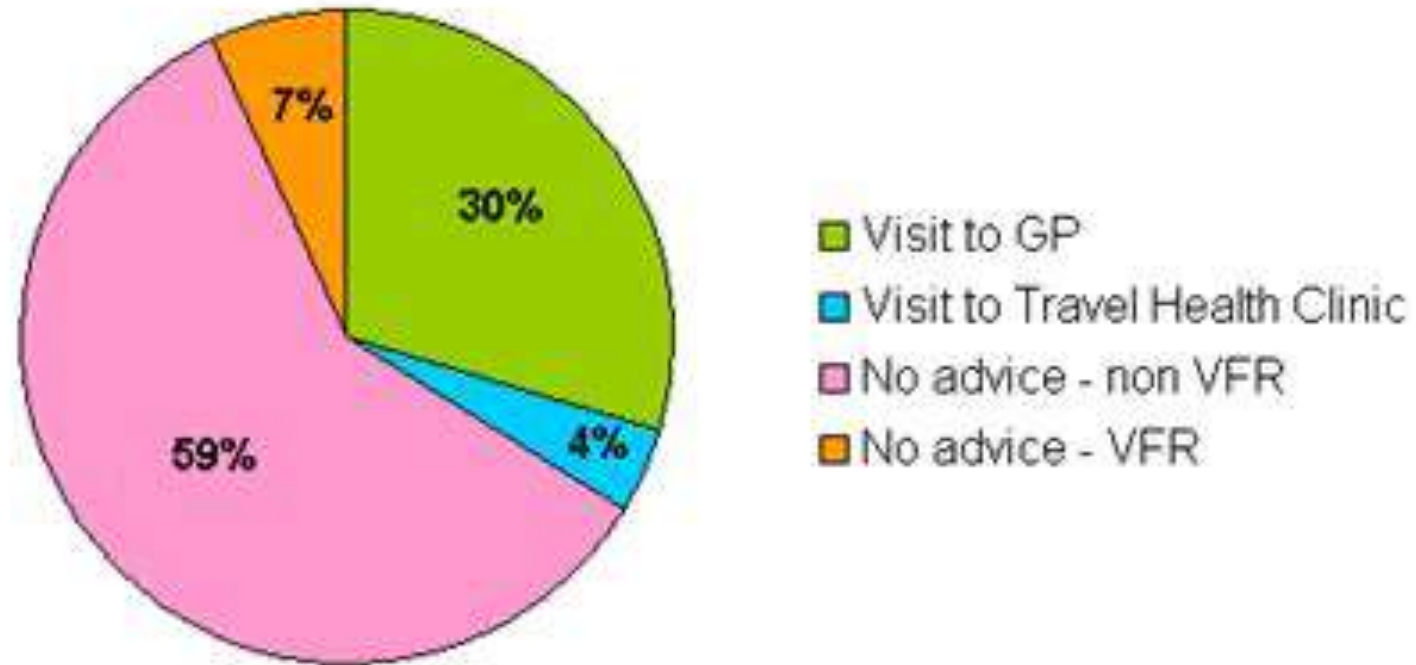

What they don't tell you...

“complacency”

Australian travellers attitude regarding health pre-travel consultation, Zwar 2007.

The major reason ...perceived low risk of infection while travelling

Past pre-travel vaccine uptake was associated with

- increasing age (OR = 1.17) and
- travel to higher-risk destinations (OR = 2.92)
- BUT VFRs were less likely to have received pre-travel vaccines (OR = 0.74 [0.56–0.97] $p = 0.028$)

**Travellers don't realise what is involved
and how much time it takes ...**

During pap smear / URTI/ BP script etc

“I'm going to XYZ.. do I need anything..”

..Need to make a separate appointment

Figure 1 Incidence rate per month of VPDs in travellers; best estimate for non-immunes

J Travel Med, taad085,
<https://doi.org/10.1093/jtm/taad085>

Everything starts with History

Been before? Where ? When?

Problems while away?

Previous vaccine records?

Past Medical history / medications

This trip

- **Where // When // Why //Who**
- **How long**
- **What activities / accommodation/ food**

Previous vaccine records

**Australian
Immunisation
record?**

Old vaccine books

**Serology for some
things**

Serology ?

- Measles
- Mumps
- Rubella
- Varicella
- Hep B
- Hep A (mostly for disease)

Have a system to work through all the topics esp vaccines

HOW VACCINES ARE GIVEN

POLIO	IPV / Adacel Polio / Boostrix IPV injection One dose of IPV if the original course was given in childhood/school. Available combined with Adacel and Boostrix. (Oral Sabin has been discontinued in Australia.)
TETANUS DIPHTHERIA WHOOPING COUGH	Adacel / Boostrix / ADT / Tetanus Toxoid Tetanus booster is one injection if the original course was given in childhood. Usually given combined e.g. Adacel or Boostrix = Tetanus, Diphtheria, Whooping cough (Pertussis) ADT = Adult Diphtheria & Tetanus
HUMAN PAPILLOMA	Gardasil 9 injection Dose depends on age. 9-14 years age: two injections 0, 6months. Over 15 years age: three injections 0, 1-2 months, 6 months
MEASLES MUMPS RUBELLA	Priorix* / MMR II* injection (Rubella is also known as German measles). Two injections give lifetime protection.
CHICKENPOX	Varivax* / Varilrix* injection Two injections: 0, 1-2 months. Zostavax* injection One injection protects against shingles.
INFLUENZA	Fluvax / Vaxigrip / Intanza / Fluarix injection Adult: one injection. Child: 6mth-9yrs: two injections 0, 1mth
PNEUMONIA	Prevenar injection Adult: one injection. Pneumovax injection Adult: one injection.
TYPHOID	Typhim Vi / Typherix injection / Vivotif* Oral One injection, or 4 capsules taken Day 1, 3, 5, & 7. Preferably given at least 2 weeks before departure.
TYPHOID + HEPATITIS A	Vivaxim = Typhim Vi + Avaxim One injection protects against Typhoid and Hepatitis A. Booster for Hepatitis A in 6 - 12 mths for lifetime protection.
HEPATITIS A	Avaxim / Vaqta / Havrix injection One initial dose, then a booster at 6-12 months.
HEPATITIS A+B	Twinrix injection Three injections: 0, 1 month and 6 months.
HEPATITIS B	HBVax II / Engerix B injection Usually three injections: 0, 1 month and 6 months. Rapid course: 0, 1, 2, 12 months or 0, 1 wk, 4 wks, 12 months.

MENINGITIS	ACWY – Menveo / Menactra / Nimenrix One injection, given at least 2 weeks before travel. B – Bexsero Two injections, spaced 1-2 months apart.												
YELLOW FEVER	Stamaril* injection One injection, given at least 10 days before travel.												
CHOLERA/ETEC	Dukoral oral Over 6 years of age: two doses of drink, given one week apart. Usually given 3 weeks before travel. Vaccine gives some protection against ETEC diarrhoea for three months.												
JAPANESE B ENCEPHALITIS	Jespect / Ixiaro injection Two injections, spaced a month apart. Imojev* injection One dose for adults.												
TICK-BORNE ENCEPHALITIS	Encepur / FSME-IMMUN injection Regular course: three injections: 0, 1-3 months, 5-12 months Rapid course: two injections: 0, 14 days.												
RABIES	HDCV / Rabipur / Verorab injection <table border="1" style="width: 100%;"> <thead> <tr> <th>Options</th> <th>Before bite</th> <th colspan="2">After bite</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Nothing</td> <td>Bite</td> <td>RIG+ 0, 3, 7, 14, (28) days</td> </tr> <tr> <td>2</td> <td>0, 7, (28) days</td> <td>Bite</td> <td>0, 3 days</td> </tr> </tbody> </table>	Options	Before bite	After bite		1	Nothing	Bite	RIG+ 0, 3, 7, 14, (28) days	2	0, 7, (28) days	Bite	0, 3 days
Options	Before bite	After bite											
1	Nothing	Bite	RIG+ 0, 3, 7, 14, (28) days										
2	0, 7, (28) days	Bite	0, 3 days										
	After rabies risk exposure <ol style="list-style-type: none"> 1. If you are NOT pre-immunised, when bitten – you need Rabies Immune Globulin (RIG) injected into the bite wound on the day of the bite. RIG is a blood product and not available in many countries. Plus you need four to five doses of vaccine in the arm over the next month. 2. If you ARE pre-immunised before exposure, you have more time to seek help and you only need two further doses of vaccine and no RIG. 												
TUBERCULOSIS	BCG* injection One injection, usually given in childhood. BCG vaccine does not work well in adults. A tuberculosis test (QuantIFERON or Mantoux) may be recommended before travel, to document immunity. If necessary, the test is repeated 3 months after return home.												
Q FEVER	Q-VAX injection One injection, given at least 2 weeks before exposure. A skin test and blood test must be done prior to vaccination.

STOP

Before vaccinating

- ALWAYS enter the Australian Immunisation Register (AIR) to check the patient's previous immunisation history.
- Check the online Australian Immunisation Handbook (the Handbook) or download the Handbook app for information about catch-up vaccinations, timing of vaccination for special risk groups or immunisationHandbook.qld.gov.au
- Check the correct vaccine dose number for each vaccine and only repeat all vaccinations to AIR as soon as possible.

Nearly 40 million children are dangerously susceptible to growing measles threat

23 November 2022 | Joint News Release | Reading time: 4 min (1042 words)

Measles vaccination coverage has steadily declined since the beginning of the COVID-19 pandemic. In 2021, a record high of nearly 40 million children missed a measles vaccine dose: 25 million children missed their first dose and an additional 14.7 million children missed their second dose, a joint publication by the World Health Organization

Cases reported in the first 4 months of the past 6 years (January through April, 2016–2021).

Extra MMR in 6-12 mth old travellers

**Regardless of

VARICELLA

[Home](#) > [Recommendations](#)

Children aged 12 months to <14 years are recommended to **receive 2 doses** of varicella-containing vaccine

All children <14 years of age are recommended to receive 2 doses of varicella-containing vaccine, with the first dose given at 18 months of age. Children should receive this dose as MMRV vaccine. See [Measles](#).

Children can receive varicella-containing vaccine from as young as 12 months of age. This provides earlier protection against varicella, which may be appropriate in the context of

Q FEVER

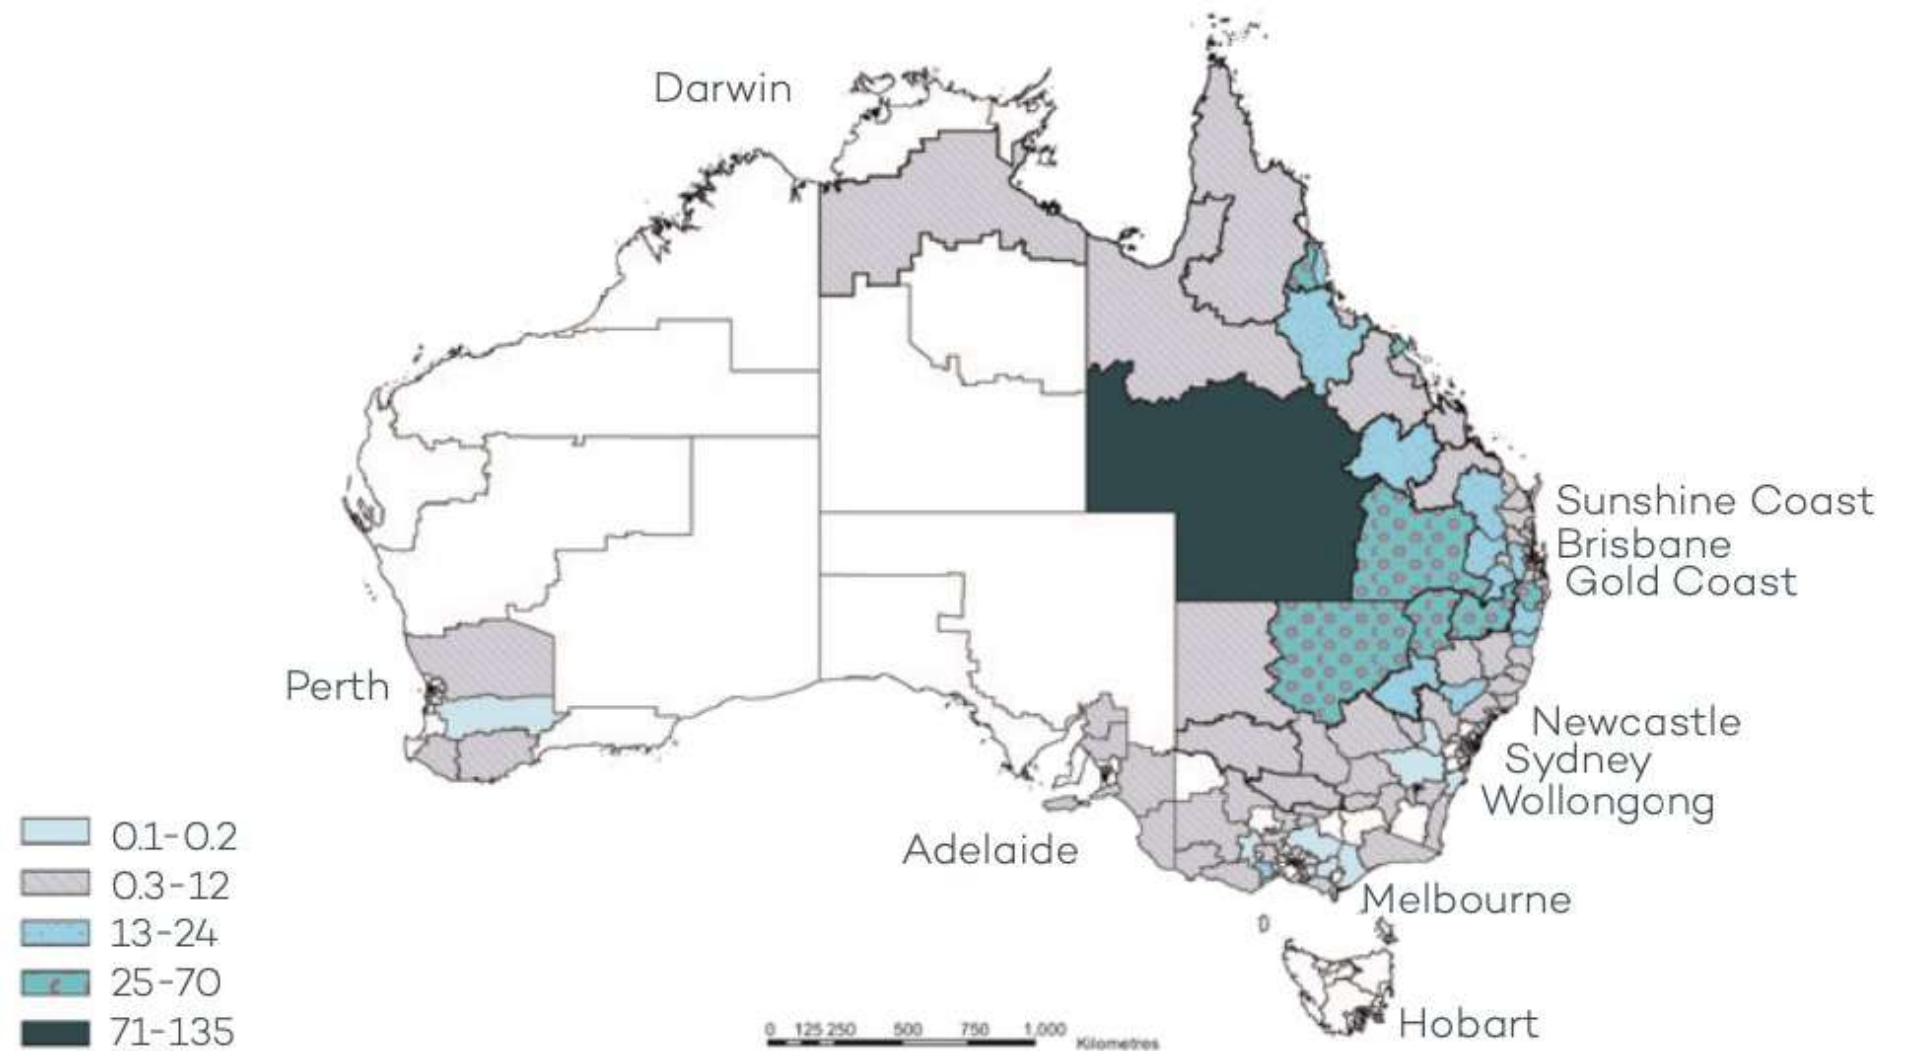

Figure 1: Notification rate for Q Fever, Australia, 2015 (cases per 100,000 population) by geographic areas.^{2,3,#}

#Geographical areas defined by Australian Bureau of Statistics (ABS) as Statistical Area Level 3 (population generally between 30,000 and 130,000)

Acute Q fever risk factors:⁴

Meat & livestock

Abattoir workers and others associated with the meat industry

Farm workers

Shearers

Stockyard workers

Livestock transport workers

Tanning and hide workers

Animal carers

Veterinarians, veterinary staff and veterinary nurses and students

Wildlife carers, hunters, zoo keepers (working with high risk animals)

Animal breeders and anyone regularly exposed to parturient animals

Staff in veterinary microbiology laboratories

Environmental

Maintenance engineers, electricians, plumbers etc in at-risk environments

Visitors to at-risk environments e.g. research workers, teachers, school students, insurance agents, sales people etc, especially in rural communities

People with indirect contact to livestock e.g. those living down-wind of livestock transport routes, processing plants, feedlots and abattoirs

People involved in rural mowing due to aerosolised dust potentially contaminated with infected animal excreta, especially kangaroos and bandicoots

Family members of the at-risk occupational groups through exposure to contaminated clothing, boots or equipment

Figure 2: Q Fever outbreaks across the world, in time and place (personal synthesis).

H G, N A, Djaballah A S, H L, A S, S T, et al. Between Livestock's and Humans, Q Fever Disease is Emerging at Low Noise. Act Scie Micro. 2019 Sep 20;2(10):104–32.

Tuberculosis

leading infectious disease killer
in the world

from drug-resistant TB
Will double every 5 years**

BCG policy by Country

The severity of national TB epidemics, in terms of the number of incident TB cases per 100 000 population per year, varies widely among countries (Fig. 2.1.3). In 2021, countries with the highest rates were mostly in the WHO African Region.

Fig. 2.1.3 Estimated TB incidence rates, 2021

Abstract

Background: Although the last 10 years have seen a slow decline in global tuberculosis (TB) incidence, it remains one of the most significant infectious diseases worldwide, with an estimated 9.6 million new cases and 1.5 million deaths in 2014. The consequences of contracting TB can be significant for the individual, with extended treatment requirements, risk of long-term complications, and risk of death.

Methods: This review examines the current evidence on the risk of TB in travellers, the impact of travel consultation on risk reduction, and the effectiveness of interventions. A literature search was conducted using Medline, Embase, and Cochrane databases. The search terms used were 'tuberculosis', 'traveller', 'risk', 'consultation', and 'prevention'. The search was limited to English language articles published between 2005 and 2015.

Results: The global TB burden is high, with an estimated 9.6 million new cases and 1.5 million deaths in 2014. The incidence of TB in travellers is low, with rates of 0.1–0.2% per year. The risk of TB in travellers is higher in those who travel to high-risk countries, who have prolonged stays, who have close contact with high-risk individuals, and who have underlying immunosuppression. Travel consultation can reduce the risk of TB in travellers, with a risk reduction of 10–20%. The effectiveness of interventions such as BCG vaccine, interferon-gamma release assay, and tuberculin skin test is uncertain.

Discussion: It is important to provide travellers with up-to-date information regarding the risk of TB in travellers, including the impact of travel consultation on risk reduction. The effectiveness of interventions such as BCG vaccine, interferon-gamma release assay, and tuberculin skin test is uncertain.

Key words: Tuberculosis, latent, BCG vaccine, interferon-gamma release assay, tuberculin skin test

Australian Immunisation handbook

- **AGE --? Under age 5**
- **INCIDENCE AT DESTINATION-- ? 40/100,000**
- **DURATION OF TRAVEL --? more than 3 months**
- **PROXIMITY OF CONTACT -- ? Grandma with TB**

Children aged ≥ 5 years travelling to countries with high tuberculosis incidence (≥ 40 cases per 100,000 population per year) are at increased risk of acquiring tuberculosis and developing severe disease.² BCG vaccine is most effective at preventing severe tuberculosis (miliary tuberculosis and tuberculous meningitis) in children. See [tuberculosis](#) and [vaccines, tuberculosis](#).

Children should ideally receive the vaccine at least 3 months before departure to a high risk destination. Consider discussing future travel plans with parents and carers of young infants at the earliest possible age.

The risk assessment should take account of the following:

- the child's age
- how long they are in the high-risk area – the longer the exposure the higher the risk of infection
- the proximity of contact to others – staying with friends or family members in the community increases the risk of infection, particularly if they have a history of recent tuberculosis
- the tuberculosis incidence at the destination

Abstract

We present the case of a 28 year old lady with refractory Crohn's Disease treated with infliximab throughout her pregnancy. Her baby was born healthy and received a Bacillus Calmette–Guérin (BCG) vaccine aged 3 months. Soon

HISTORY

- AGE - care with other live vaccines
- Medical problems so far/ Medication / Allergies / sick or feverish today
- Out of Australia yet
- Leaving when
- Visitors with potential TB?
- More trips to the same area before the child is 5 years of age

< 6 mths age ...biological mother ... immunosuppression???

Mantoux

- **CDC suggests better in children < 5 yrs**
- **No blood test**
- **Cheaper**
- **Better guide if going to do a BCG??**

QuantiFERON 2001 approved FDA

- Sensitised white cells release Gamma Interferon on exposure to TB antigen
- measures the level of IFN-g
- Limited data children under 5yo
- ~92 % accuracy
- specific to human TB
- One visit

CARE of BCG

- **No fever**
- **Takes 1-8 weeks to appear**
 - **Keep it mostly dry**
 - **No bandaids**
 - **Don't pick or scratch**
- **3 months to be effective**
- **No vaccines in left arm until healed**
- **Avoid live vaccines one month before and after**

Effects of BCG

1

Caring for the BCG (Tuberculosis vaccine) site

We use a Non-toxic, Registered Vaccine. Vaccine is manufactured by the **AJ VACCINES DENMARK**. It is accredited by the **World Health Organisation, Geneva and used in New Zealand AND used across Australia.**

This vaccine does NOT cause a fever. Paracetol is usually not needed.

BCG vaccine starts as white 'bubble', which will disappear within an hour.

The pustule usually starts between 1-8 weeks after the vaccination

The pustule usually starts as a small red lump. This grows and may swell to contain fluid or even pus or blood. A crust or a scab may form, eventually the scab will detach, and may release fluid or a pus-like discharge. Eventually, it settles to a red mark, which fades slowly to a small scar. **The spot can take 6 to 9 months to fully heal.** Very rarely - a bump will appear in the armpit of the vaccinated arm. Avoid getting the scar sunburned. Photos are at www.thevaccinodoctor.com.au/bc-vaccine

Sometimes only a small red spot is present at the vaccine site, or nothing happens at all: the vaccine will still be effective.

BCG takes about **1 month to be fully effective** then is valid for life.

CARE INSTRUCTIONS - When there is a pustule:

Keep it mostly dry: Bath or shower as normal. If swimming get out of the water after 10 minutes. Dry the pustule by gentle patting, (do not rub) and then expose it to the air.

NEVER cover the pustule with a bandage, plaster or dressing. Cover with a loose sleeve only! (Scratching through the sleeve is safe). Avoid tight or itchy sleeves such as woolen jumpers. Food as normal.

IMPORTANT: Leave the site of the BCG pustule alone. Never pick, scratch, squeeze or scrub the pustule. This may increase the pain, time to healing, risk of infection and size of scar. Use tissue or cotton ball to dab any ooze or fluid dispose in normal rubbish. Do not apply cream or moisturiser on the pustule. A small amount of baby oil in the bath is safe. Advise caregivers to avoid holding the affected part of the arm. With correct care, the BCG vaccination site will not usually cause pain. Diet can be normal.

Avoid vaccines in left arm until pustule has fully healed.

Avoid LIVE vaccines (Routine 12 & 18 month vaccines) for a month before or after BCG.

Please notify me if the redness expands to more than the size of a 50c piece, if the armpit becomes sore or develops swellings, or if more extensive sores develop around the vaccine site, or if it takes > 9 months to heal.

This vaccine will take 1 month to take effect: 28 October 2025

If you wish a photo review, please send child's name and date of birth and date of BCG to

china@thevaccinodoctor.com.au

Live vaccines together or 1mth apart
Course
Fill in rest

Scheduling

If the recommended intervals between doses are exceeded, there **is no need to recommence the schedule or give additional doses**, because the immune response is not impaired by such delay.
